Cleaning and Maintenance

“Add years to the life of your sails”

All fabric manufacturers agree that correct routine and preventative maintenance extends the lifespan of your sail. This includes cleaning at least once a year, with a cleaning agent specified by the fabric manufacturer so as to not void the warranty. Similarly, the fabric must be cleaned in the appropriate method specified by the manufacturer.

Sail Structures designs and installs world class shade sails and tensile membranes for the commercial and residential markets in Australia. These sails are valuable assets, and we believe all our customers should have access to quality 'life of product' services to optimise the financial and social return of this investment.

When a sail is removed for cleaning, this is the ideal time to survey all components for wear and tear. To optimise the lifespan of the sail, Sail Structures may recommend some preventative maintenance. This could include the patching of a small hole, tear, or re-stitching of a seam; that, if left unattended over time, may render the sail unsalvageable.

The Sail Structures Asset Management Team can log each time your sail is cleaned and maintained, 'confidentially' in our asset register.

Depending on the size of your portfolio, you may wish to begin a conversation with Sail Structures regarding the benefits of outsourcing part or all of your shade structures portfolio - hassle free with quality reporting. We are one of the preferred suppliers to **Department of Education and Training** – under DETE PSA 101227 - Provision of Shade Structures for the provision of shade sails and permanent roof structures; and a prequalified supplier to **Local Buy (Asset Management Services - Contract: BUS 252-0615)**.

Should you have any questions pertaining Sail Cleaning and Maintenance, or Asset Management, please don't hesitate to contact our office today.
